If using our premixed syringe eject some paste and skip to step 3.

1 : Before starting expose the powder to sunlight for 5 minutes to charge it.

2 : Mix a small amount of powder and binder together until a paste like consistency is achieved. If using one of our vintage kits then add a small amount of tint from the syringe to achieve the color you require.

3 : View the mix in a dark room to be sure it is thoroughly mixed.

4 : Apply the lume paste using a fine pointed object (technical pen, needle, watch oiler, etc.) Many users work under a microscope; depending on your eyesight an eye glass may suffice.

Patience, practice, and a steady hand are required but not included, as they are difficult to ship!

Store in a cool dark place.
